## Sequence Analysis: Part II. Pattern Searching and Gene Finding

Fran Lewitter, Ph.D.  
Director  
Bioinformatics & Research Computing  
Whitehead Institute

# *Topics to Cover*

---

- Pattern searching
  - PSI-BLAST
  - PHI-BLAST
  - Finding patterns
- Gene finding

# PSI-BLAST

- **P**osition **S**pecific **I**terative BLAST uses a profile (or position specific scoring matrix, PSSM) that is constructed (automatically) from a multiple alignment of the highest scoring hits in an initial BLAST search.
- The PSSM is generated by calculating position-specific scores for each position in the alignment. Highly conserved positions receive high scores and weakly conserved positions receive scores near zero.
- The profile is used to perform a second (etc.) BLAST search and the results of each "iteration" is used to refine the profile. This iterative searching strategy results in increased sensitivity.

# Start with a BLASTP search

| Sequences with E-value BETTER than threshold |  |                                     |                           |
|--|--|-------------------------------------|---------------------------|
|  |  | Score                               | E                         |
|  |  | (bits)                              | Value                     |
| Sequences producing significant alignments:  |  |                                     |                           |

EMBOSS programs; web and Unix

# Interesting features in DNA

- *Structure of genes - exons, introns, etc.*
- *Non-coding RNAs - including microRNAs and other small RNAs*
- *Promoter sites*
- *Alternative splice forms*

# Problem to Solve

# Types of Signals to Detect

- Transcriptional
  - TSS
  - TATA box
  - PolyA
- Translational
  - Kozak (CC A/G CCAUGG)
  - Termination codon (UAA, UAG, UGA)
- Splicing
  - Introns - GT.....AG

# Gene Finding Strategies

- Content-based methods
  - codon usage, compositional complexity
- Site-based methods
  - presence or absence of specific pattern or sequence
- Comparative methods
  - determination based on homology

# RepeatMasker

## RepeatMasker Server

RepeatMasker is a program that screens DNA sequences for low complexity DNA sequences and interspersed repeats. The masked out sequence can be used to for BLAST search.  
Please refer to: Smit, AFA & Green, P "RepeatMasker" at <http://repeatmasker.genome.washington.edu>

[Home](#) || [Help](#) || [Check Queue](#) || [Your Suggestion](#) || [References](#) || [RepBase Update](#)

run\_repeatmasker

Reset

Enter your sequence (*sequence in fasta format*)

( OR ) Upload the file

[Browse...](#)

DNA Source is from

Primates  
Rodents  
Other Mammals  
Other Vertebrates  
Arabidopsis  
Grasses  
Drosophila

Running options

- Fast (quick search, 3-4 times faster)  
 Slow (slow search, 2.5 times slower)

Repeat Options

- Do not mask low\_complexity DNA or simple repeats  
 only masks Alus (and 7SLRNA, SVA and LTR5)(only for primate DNA)  
 only masks low complex/simple repeats (no interspersed repeats)

Output Options

- Show Alignments  
 Mask with X's to distinguish masked regions from Ns already in query  
 Produce an annotation table with fixed width columns

[html validate this page](#)

# RepeatMasker

## Summary:

Total length: 8750 bp

GC level: 35.61%

Bases masked: 6803 bp (77.75%)

# Coding Measures

---

- Look at frequencies of codons (e.g. redundancy of genetic code; Leucine = UUA, UUG, CUU, CUC, CUA, CUG)

- 6-tuple or hexamer approach

ACCTCG   TACTCG   GCCCTC  
Thr   Ser   Tyr   Ser   Ala   Leu

# GENSCAN

---

- MM - prob for a given nuc to occur at position  $p$  depends on nuc occupying previous  $k$  positions
- Generalized Hidden Markov Model (GHMM)
- Optimize module performing signal recognition
- Incorporates influence of C+G content
- Considers gene models on both strands
- Can identify multiple genes

Burge and Karlin, JMB:268:78-94, 1997

# Gene Finding Programs

---

- FGENESH - Softberry
- GeneID - Barcelona
- Genscan - Stanford and MIT
- GenomeScan - MIT
- MZEF/First exon - Cold Spring Harbor
- Twinscan - WU
- Ecgene - Korea (EST clustering)
- SGP - Barcelona (human-mouse homology)

# HMR195 Test Set

---

- 103 human, 82 mouse, 10 rat sequences
- Sequence new since August, 1997
- Genomic sequences containing exactly one gene
- No mRNA sequences, pseudogenes or alternatively spliced genes
- The mean length of sequences is 7,096 bp

*Rogic, Mackworth and Ouellette, Genome Research 11:817-832, 2001*

# Definitions

---

- ***Sensitivity:*** the proportion of true sites(e.g., exons or donor splice sites) that are correctly predicted =  $TP/(TP + FN)$
- ***Predictive value of positive results (“Specificity” in gene finding literature):*** the proportion of predicted sites that are correct =  $TP/(TP + FP)$
- ***Specificity:*** the proportion of non-sites that are predicted to be non-sites =  $TN/(TN + FP)$

# Program Comparisons Results

- Genscan and HMMgene had reliable scores for exons
- Nucleotide Sn = .95 for Genscan and .93 for HMMgene.
- Sp = .90 and .93, respectively
- Accuracy dependent on G+C content

*Rogic, Mackworth and Ouellette, Genome Research 11:817-832, 2001*

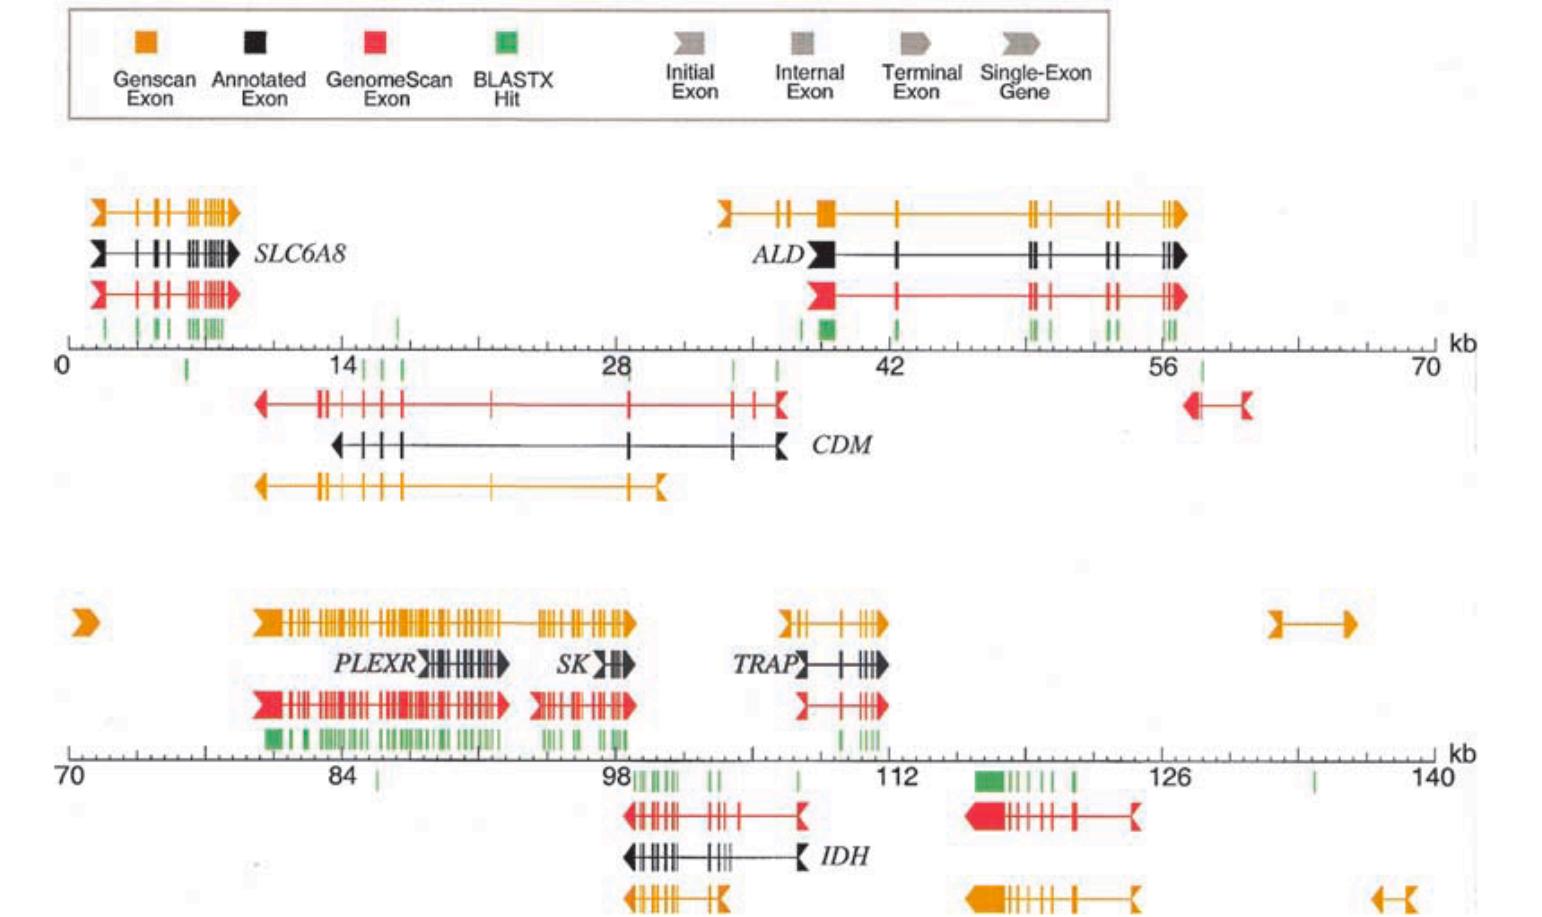

**Table 2.** Accuracy versus Signal Type

| Programs     | Signal type       |                     |                  |                  |
|--------------|-------------------|---------------------|------------------|------------------|
|              | start codon (195) | acceptor site (753) | donor site (753) | stop codon (195) |
| FGENES       | 0.67<br>(0.63)    | 0.80<br>(0.77)      | 0.85<br>(0.82)   | 0.75<br>(0.72)   |
| GeneMark.hmm | 0.46<br>(0.60)    | 0.81<br>(0.75)      | 0.82<br>(0.78)   | 0.57<br>(0.64)   |
| Genie        | 0.56<br>(0.57)    | 0.77<br>(0.82)      | 0.78<br>(0.83)   | 0.72<br>(0.73)   |
| Genscan      | 0.61<br>(0.78)    | 0.87<br>(0.80)      | 0.90<br>(0.84)   | 0.76<br>(0.86)   |
| HMMgene      | 0.75<br>(0.78)    | 0.81<br>(0.85)      | 0.83<br>(0.87)   | 0.78<br>(0.81)   |
| Morgan       | 0.43<br>(0.43)    | 0.66<br>(0.57)      | 0.65<br>(0.56)   | 0.39<br>(0.39)   |
| MZEF         | —                 | 0.59<br>(0.65)      | 0.66<br>(0.73)   | —                |

For each program, the proportion of actual signals identified correctly (the upper number) and the proportion of predicted signals that are correct (the lower number) are averaged over all signals belonging to a particular type. The number in parenthesis in the header of each column represents the number of signals of each type in the HMR195 dataset.
